FIRST AID TRAINING

Automated External Defibrillator (AED) Competent User - 1 Day

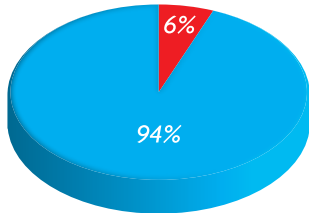

This comprehensive course exceeds the core competences as laid down by the UK Resuscitation Council.

Sudden cardiac arrest occurs due to an electrical malfunction which disrupts the heart's normal rhythm (Ventricular Fibrillation or VF); left untreated it can lead to death in a few minutes.

90% of casualties in Cardiac Arrest are in a VF Arrest!

The only treatment for a VF arrest is a controlled electrical shock to the heart (Defibrillation).

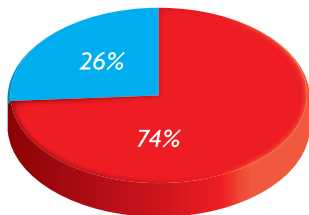

The Current Survival Rate for Cardiac Arrest in the UK is Only:

Current UK Survival Rates:

6% Survive
94% Die

With the use of an AED within 3 minutes of Cardiac Arrest the survival rate goes up to:

Patient in VF and Shock Delivered in 3 Minutes:

74% Survive
26% Die

AED's save lives, this is a proven fact. The course is designed to give students the skills and confidence to use the AED's.

During the course the student will learn about:

- Heart Conditions.
- Basic Life Support & Cardio Pulmonary Resuscitation.
- Safe Use of the AED.
- We ensure the students have plenty of time to practice using the AED.

To ensure that students receive appropriate training within the guidance provided by the UK Resuscitation Council Guidelines of 1 trainer per 6 students, we only have 6 places available per course.

Call the Help! line for free advice on your first aid requirements.
